

## CLINICAL POPULATION MANAGEMENT

### PHASE ONE | STEP 2

#### **Select a chronic disease and generate a list of all patients in your practice with that disease.**

Once your population registry software is ready to use, the easiest way to begin building your population database is one disease at a time. So select a single disease you'd like to begin with and use your billing system's ICD-9 codes to generate a list of all your patients with that disease. The only information you need to extract is name, gender, and date of birth.

We highly recommend generating an electronic list, but if this isn't possible you can print out a hard-copy list instead.
